

Development of HYSPLIT inverse modeling technique to improve particulate matter (PM_{2.5}) forecasts in the US

Tianfeng Chai^{1,2}, and Ariel Stein²

1: Cooperative Institute for Climate & Satellites –
Maryland, University of Maryland

2: NOAA Air Resources Laboratory

Motivation

- Smoke from wildfires has significant negative impacts on public health;
- Many extreme events are caused by $PM_{2.5}$ emitted from large wildfires;
- The $PM_{2.5}$ forecast quality is greatly hindered by the large uncertainties of the wildfire emission estimates;
- We aim to objectively and optimally estimate the fire sources based on the satellite observations of the fire plumes.

Photo taken around noon 8/29/2015 from the Highway 26 viewpoint northeast of Prairie City. Smoke from the Canyon Creek Fire was heading in northeast direction.

A helicopter makes a water bucket drop as it flies through smoky air while fighting a wildfire that flared up in the late afternoon near Omak, Wash., on Thursday (Aug 27, 2015). (Ted S. Warren/AP)

<http://www.seattletimes.com/seattle-news/northwest/washington-wildfires-update-2/>

Meanwhile since Friday, more than 1,000 firefighters have struggled with a blaze started by lightning in the Chelan, Wash., area, where at least 49 buildings have been destroyed and authorities have issued evacuations that affect some 3,000 people.

Smoke forecasts with HYSPLIT: Current status

NOAA NESDIS HMS Smoke and fire detection

Incorporates imagery from NOAA and NASA satellites (GOES-West, GOES-East, Terra/Aqua MODIS, AVHRR on NOAA-15/-17/-18)

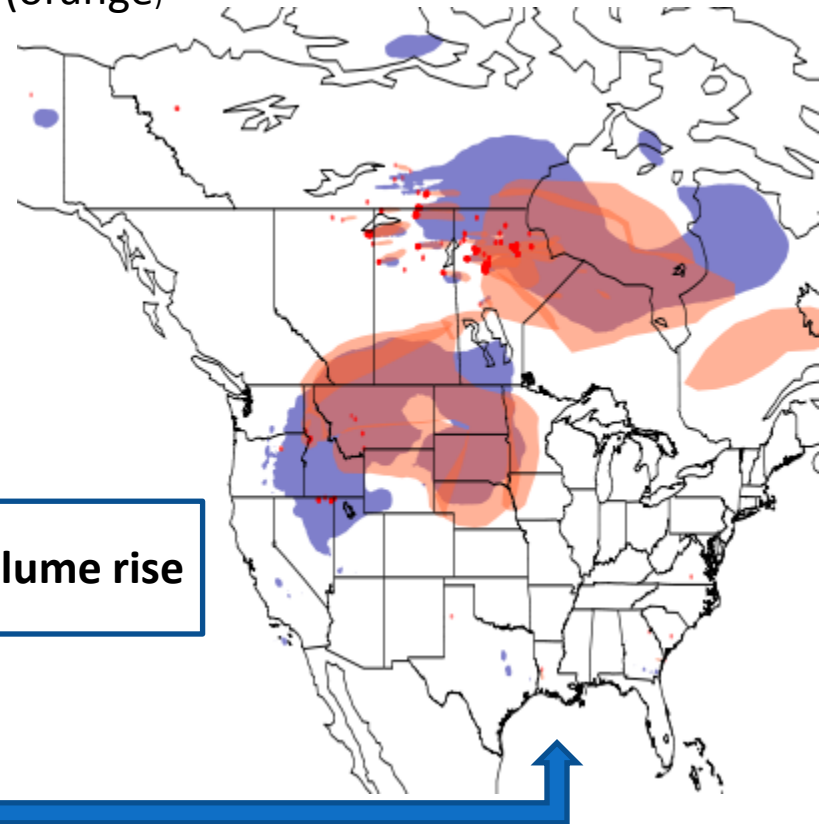

Provides fire locations,
starting time, durations

USFS's BlueSky: Estimate $PM_{2.5}$ emissions and plume rise

Emission aggregated and assumptions
are made to for the forecasting period

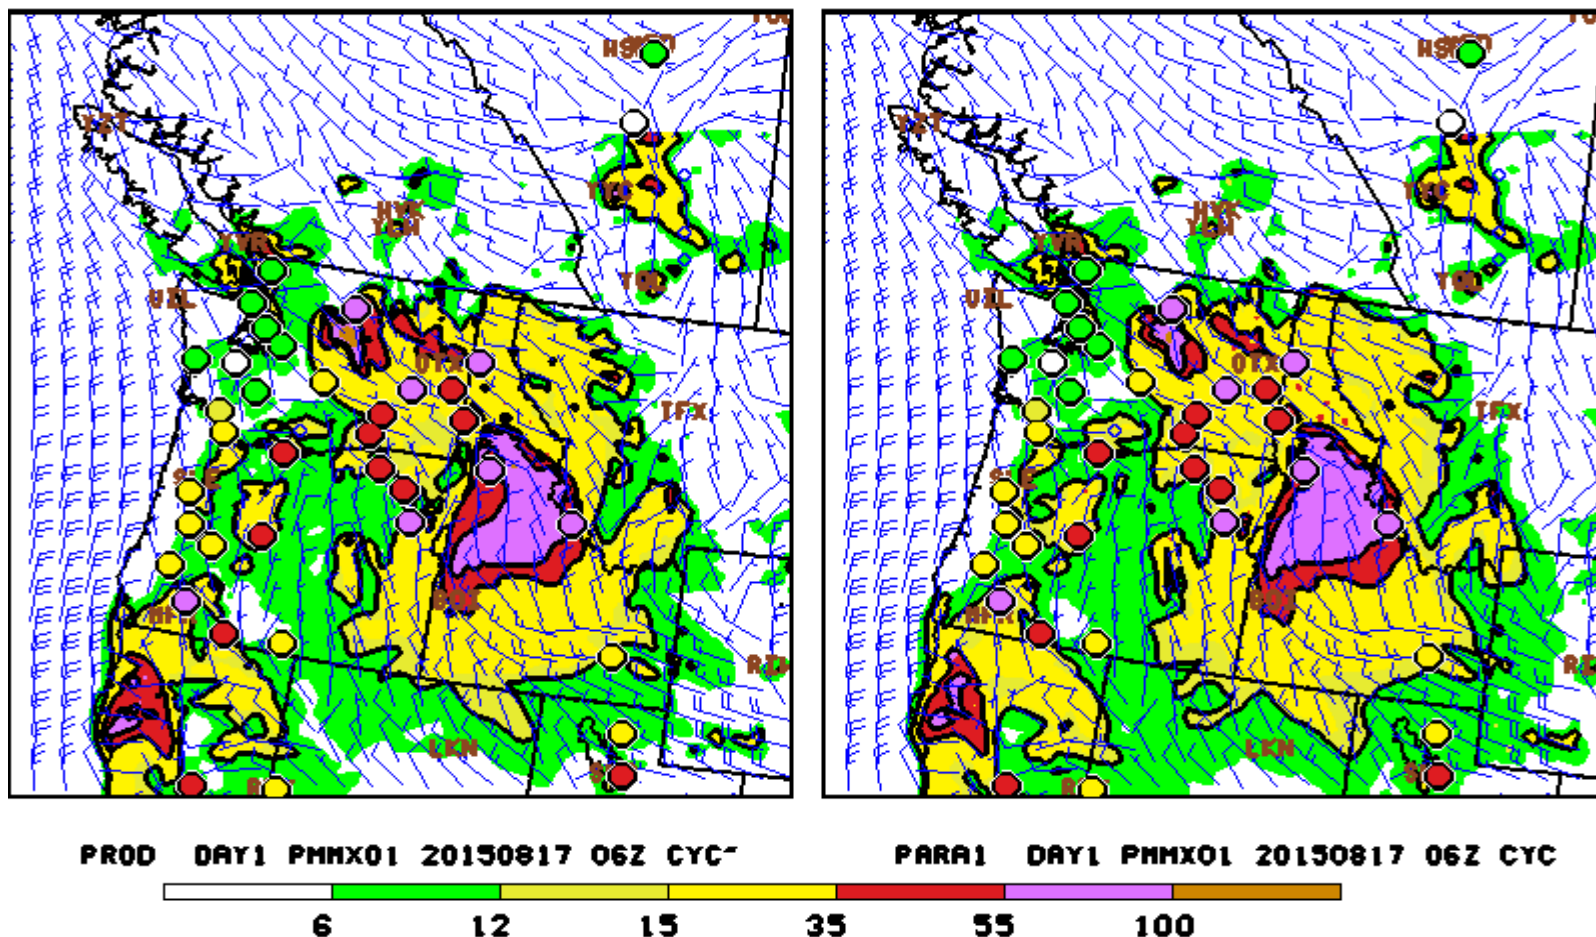

Smoke column from the HYSPLIT model (blue)
and NESDIS Hazardous Mapping System
(orange)

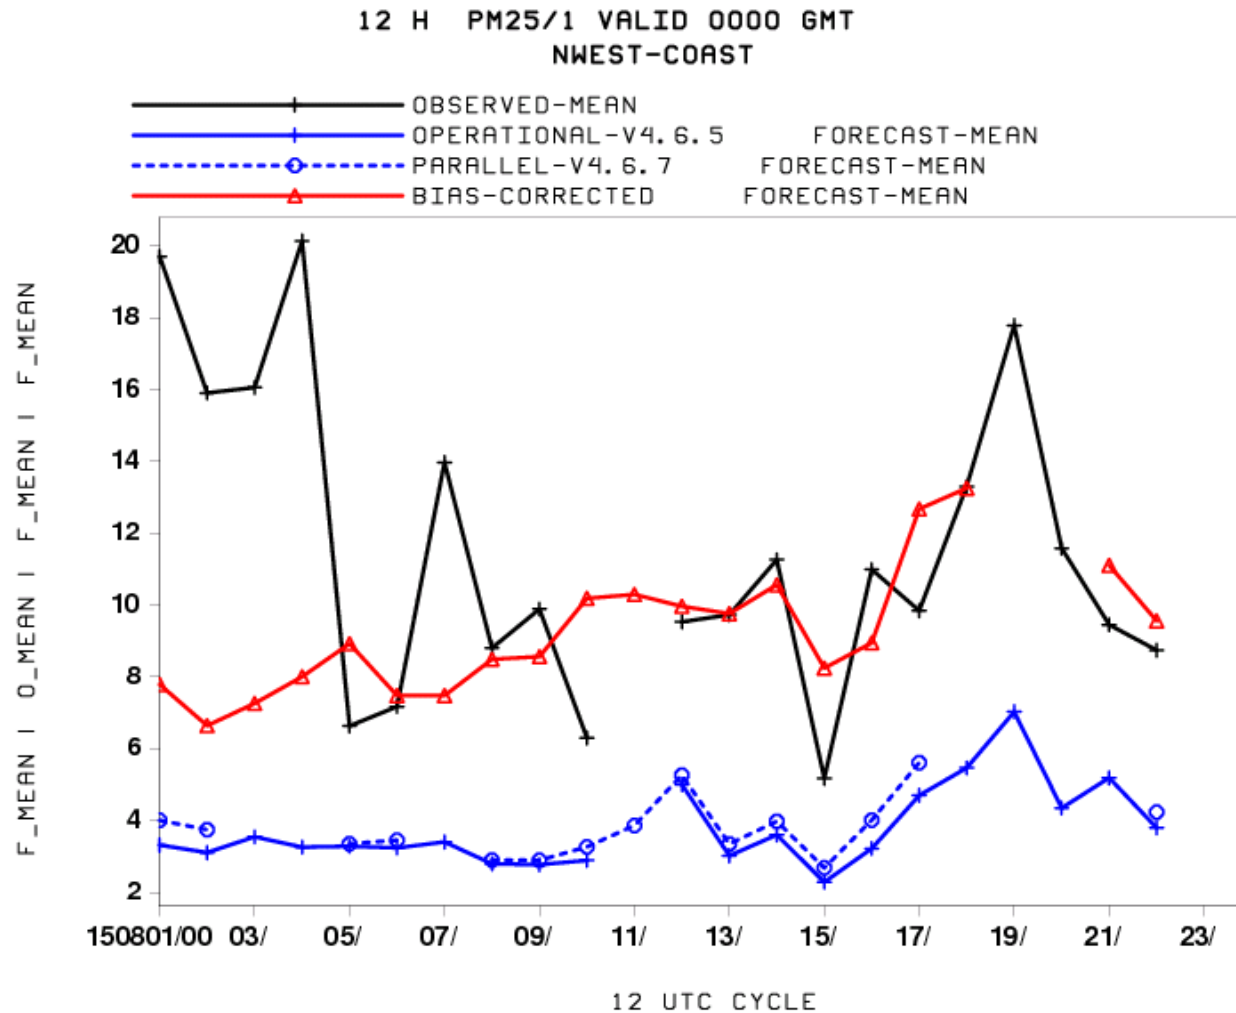

Operational since March, 2007

NOAA NAQFC PM_{2.5} forecasts with CMAQ

BlueSky emission terms similar to HYSPLIT added to CMAQ PM_{2.5} forecasts since January, 2015

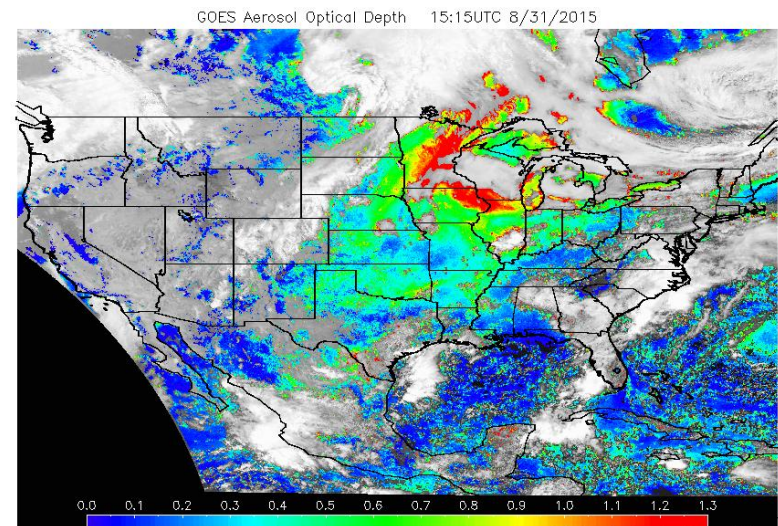

PM_{2.5} forecasts with CMAQ: underestimation

NOAA NESDIS GOES Aerosol/Smoke products (GASP)

The **GASP** product is a retrieval of the Aerosol Optical Depth (AOD) made from the current GOES West/East visible imagery. Satellite measured aerosol optical depth (AOD) is available at a **30-minute interval** and **4 km X 4 km** spatial resolution during the sunlit portion of the day. (<http://www.ssd.noaa.gov/PS/FIRE/GASP/gasp.html>)

Can we objectively and optimally estimate the fire sources based on the satellite observations of the fire plumes, instead of using BlueSky to estimate the emissions?

Methodology

- An independent HYSPLIT simulation starting at each HMS fire location with given starting time and duration is run with unit source, at several possible release height to generate a *Transfer Coefficient Matrix (TCM)*.
- Source terms are solved by minimizing a cost function built to mostly measure the differences between model predictions and observations, following a general data assimilation approach.

Hourly gridded GASP

$$\mathcal{F} = \frac{1}{2} \sum_{i=1}^N \sum_{k=1}^Z \frac{(q_{ik} - q_{ik}^b)^2}{\sigma_{ik}^2} + \frac{1}{2} \sum_{m=1}^M \frac{(c_m^h - c_m^o)^2}{\epsilon_m^2} + \mathcal{F}_{other}$$

Twin experiments

- In twin experiments, known wildfire sources are released to generate smoke plumes. Then pseudo-observations (satellite mass loadings) are generated based on the HYSPLIT simulation results ;
- With exact solutions available, the inverse algorithm can be fully evaluated.

9 fire locations, constant releases each day for 2 days from 6Z on 8/17/15, at 1500m or 2000m, MET: gdas1

Hourly, at $0.5^\circ \times 0.5^\circ$ resolution

Mass (kg/m^2)

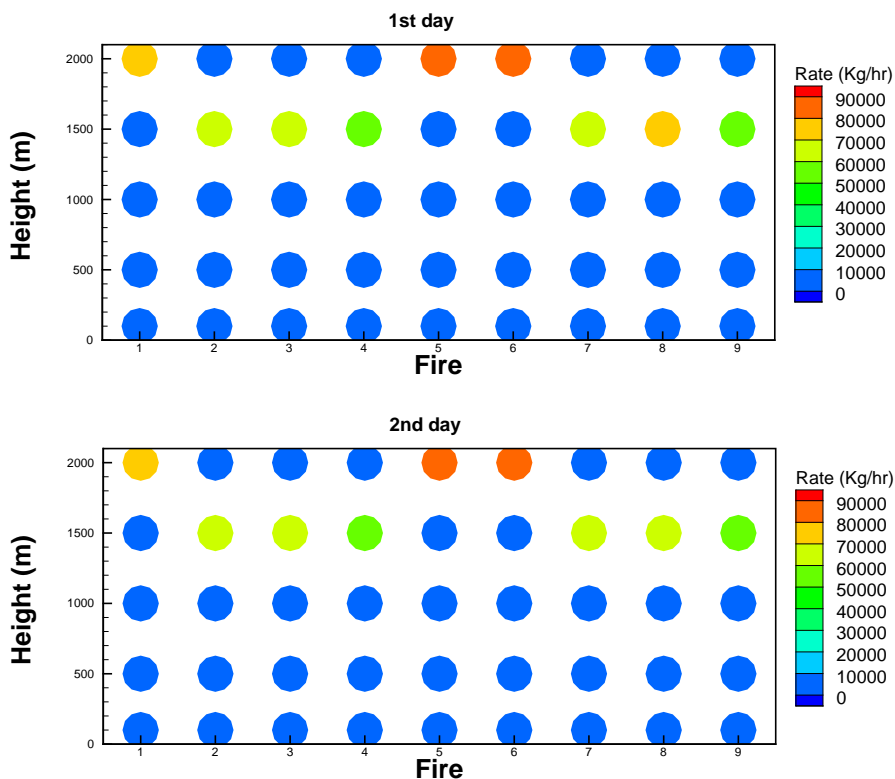

1E-10	1E-09	1E-08	1E-07	1E-06	1E-05	0.0001	0.001
-------	-------	-------	-------	-------	-------	--------	-------

Case 1:

- All 48 hourly non-zero mass loadings are assumed retrieved accurately;
- $\ln(q_{ik})$ as control variables to avoid negative emission results;
- First guess is 10^5 kg/hr at all location/height;
- Background term effect is minimized with extremely large uncertainty given ;
- Observations uncertainties at $10\% M + 0.003 \text{ kg/m}^2$;
- Minimization stops after cost function reduced to be $10^{-6} F_{init}$.

Case 1 result

Actual sources

48 hr observations  24 hr observations

Case 2: Remove 1st day observations from Case 1

Source term error statistics

	Source term	MAE (kg/hr)	Normalized MAE	RMSE (kg/hr)	Normalized RMSE
Case 1	Day 1	534.9	0.77%	841.4	1.21%
	Day 2	1760.5	2.53%	3332.5	4.78%
Case 2	Day 1	1985.8	2.85%	3310.2	4.75%
	Day 2	1393.0	2.00%	2943.2	4.22%

Spatial coverage

Case 3	Day 2 observations, w/o Region A
Case 4	Day 2 observations, w/o Region B
Case 5	Day 2 observations, w/o Region C

Source term error statistics

	Source term	MAE (kg/hr)	Normalized MAE	RMSE (kg/hr)	Normalized RMSE
Case 3	Day 1	606.4	0.87%	1156.3	1.66%
	Day 2	301.2	0.43%	573.4	0.82%
Case 4	Day 1	23834.6	34.21%	32157.9	46.16%
	Day 2	66177.5	94.99%	78653.3	112.90%
Case 5	Day 1	3974.9	5.71%	8803.3	12.64%
	Day 2	3400.6	4.88%	10663.2	15.31%

Observation errors

- 2nd day observations only;
- without spatial blocking;
- Gaussian-distributed errors are added to pseudo observations.

Source term error statistics

	Source term	MAE (kg/hr)	Normalized MAE	RMSE (kg/hr)	Normalized RMSE
Case 6 10%	Day 1	1448.6	2.08%	2259.7	3.24%
	Day 2	4418.7	6.34%	11121.8	15.96%
Case 7 20%	Day 1	2105.8	3.02%	3954.7	5.68%
	Day 2	8567.9	12.30%	22884.4	32.84%
Case 8 50%	Day 1	6227.6	8.94%	12047.1	17.29%
	Day 2	22034.5	31.63%	67298.2	96.60%
Case 9 100%	Day 1	10104.2	14.50%	19759.9	28.36%
	Day 2	34560.9	49.61%	131203.9	188.33%

Summary

- Wildfire emission inversion system has been built based on HYSPLIT model, its TCM, and a cost function;
- With pseudo observations generated using HYSPLIT model simulations (twin experiments), true emissions (release height and emission rate) can be recovered;
- First day emission sources are easier to estimate than the second day emissions;
- Spatial coverage of satellite retrieval is important;
- 100% satellite retrieval errors resulted in 17.3%/28.4% normalized MAE/RMSE errors of first day emission rates;
- The system will be further tested before implementation with real observations.

Thank you!

Twin experiments
